

Wide Area Networks (WANs)

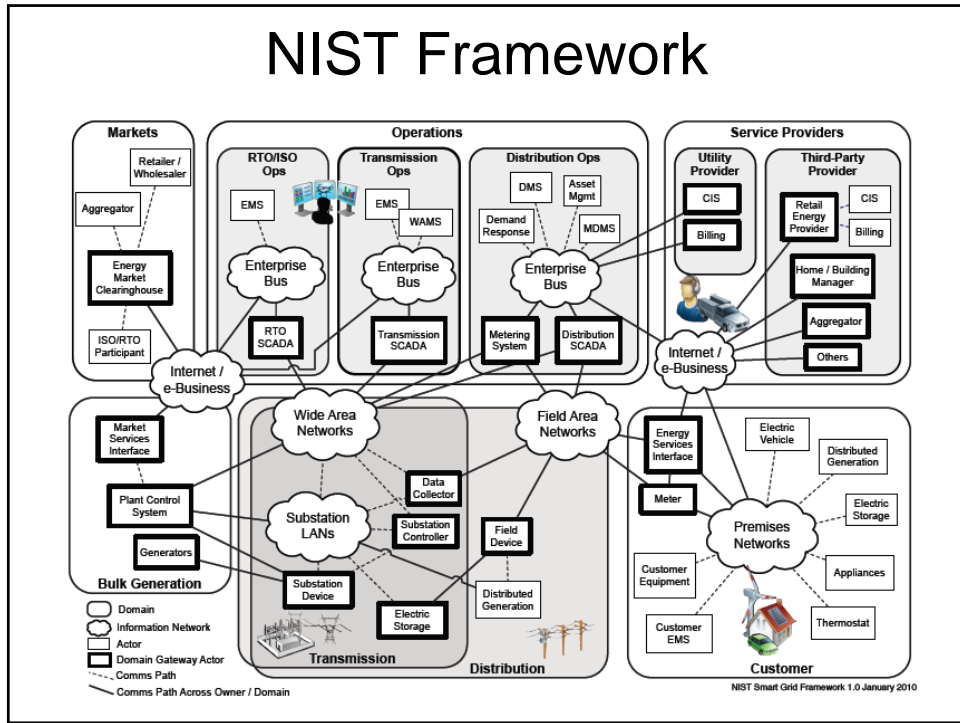

CS 687
University of Kentucky
Fall 2015

Acknowledgment: These slides have used resources (presentations, documents, pictures) available on the web, including but not limited to slides by Dr. Bob Kinicki from Worcester Polytechnic Institute, slides from Perterson and Davie's book on Computer Networks.

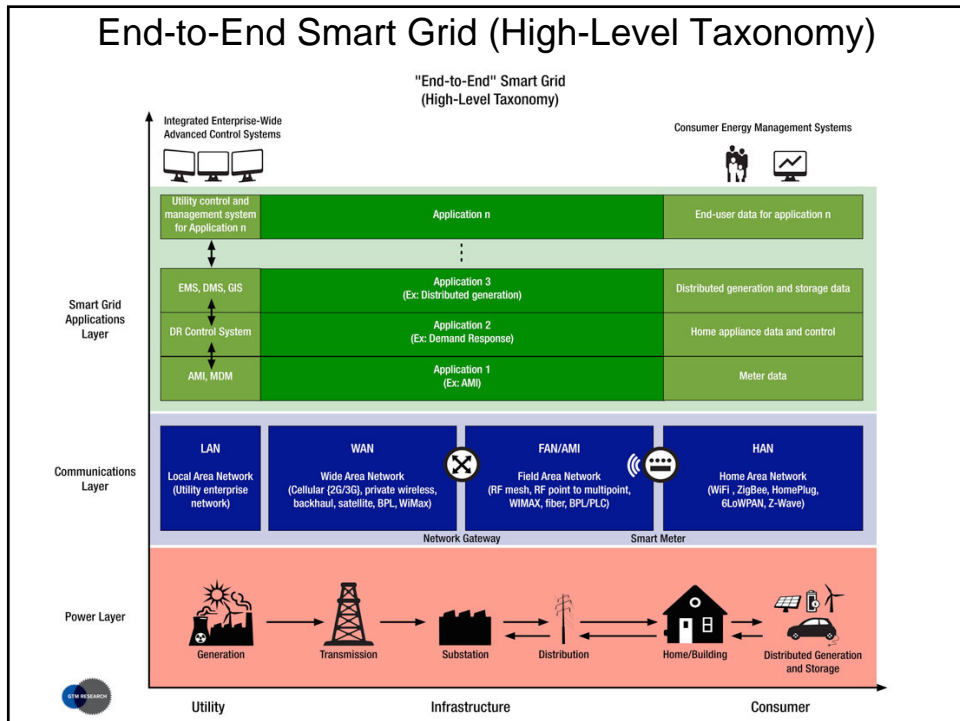

Outline

- WAN
- Fiber Optical Network
- SONET
- WiMAX

NIST Framework

End-to-End Smart Grid (High-Level Taxonomy)

Wide Area Networks

- A wide area network (WAN) is a telecommunication network that spans a large geographical area (i.e., any network that links across metropolitan, regional, or national boundaries).
- Examples of WANs
 - ISDN
 - X.25
 - Frame Relay
 - ATM
 - SONET (Synchronous Optical Network)
 - WiMAX

Fiber Optical Networks

Fiber Optics

- Fiber Optics are cables that are made of optical fibers that can transmit large amounts of information at the speed of light.

The Cable

- Fiber Optic have three major characteristics
 - Composed of fibers either glass or plastic and sometimes both
 - Are very flexible
 - Have different tips

Components

- Outside Jacket
- Cladding
- Core

Glass Fibers

Characteristics

- Glass Core
- Glass Cladding
- Ultra Pure Ultra Transparent Glass
- Made Of Silicon Dioxide
- Low Attenuation
- Popular among industries

Total Internal Reflection in Fiber

Advantages of Optical Transmission

- Large bandwidth permits high data transmission, which also supports the aggregation of voice, video, and data
- Technological improvements are occurring rapidly, often permitting increased capacity over existing optical fiber
- Immunity to electromagnetic interference reduces bit error rate and eliminates the need for shielding within or outside a building
- Glass fiber has low attenuation, which permits extended cable transmission distance
- Light as a transmission medium provides the ability for the use of optical fiber in dangerous environments
- Optical fiber is difficult to tap, thus providing a higher degree of security than possible with copper wire
- Light weight and small diameter of fiber permit high capacity through existing conduits

Disadvantages of Optical Transmission

– Cable splicing:

- **Welding or fusing:** you must clean each fiber end, then align and carefully fuse the ends using an electric arc.
 - Time consuming
 - Least amount of signal loss between joined elements.
- **Gluing**
 - Bonding material that matches the refractive index of the core of the fiber.
 - Time consuming
 - Higher loss of signal power than fusing.
- **mechanical connectors**
 - Considerably facilitate the joining of fibers,
 - More signal loss than do the other two methods
 - Can reduce the span of the fiber to a smaller distance.

Cost

- On a (bit/s)/km basis, the fiber cost will always be less than that for copper cable.
- Some organizations may require only a fraction of the capacity of the optical fiber.
 - It is often difficult to justify fiber to the desktop and similar applications where the cost of copper cable may be half or less than the cost of fiber.

SONET/SDH

- Current transmission and multiplexing standard for high speed signals
 - North America: Synchronous Optical Network (SONET)
 - Europe, Japan and rest of the world: Synchronous Digital Hierarchy (SDH)
